The Extended Suite Roadmap

Architecture, Dependency Law, and Frontier Discipline for Papers A–AN
A Proposed Paper AO for the Dream-Paper Suite

Evan Thomas Kotler

March 20, 2026

Abstract

Paper H described the architecture of the dream-paper suite through Papers A–G. The suite has since grown by thirty-six papers, adding the exhaustion program (Papers Y–Z), the universal-object program (Papers AA–AH), the sector-unification program (Papers AI–AK), the continuum-realization program (Papers AL–AM), and the reconstruction program (Paper AN). The suite now spans Papers A through AN and contains two fully proved programs and one live frontier.

The present paper, Paper AO, provides the updated roadmap. It records the extended dependency graph, the complete status map, the suite's two proved-program summaries, and the frontier architecture. Its goal is identical to Paper H's: make every inference honest by making every dependency explicit.

Contents

1 The suite at a glance **2**

7 Conclusion **6**

1 The suite at a glance

1.1 Three programs, two complete

The suite contains three logically distinct programs.

Program 1: The Finite Kernel and First Bridges (Papers A–G). Proved the finite theorem package unconditionally (Paper A), isolated locality, capacity, and certificate doctrine (Papers B–D), extracted finite sector prototypes (Paper E), named the Yang–Mills and Navier–Stokes frontiers (Papers F–G). Roadmap (Paper H) and administrative papers (Papers I–L).

Program 2: The Bridge Chain and Exhaustion (Papers M–Z). Extended the sector into operator, semigroup, and Laplacian profiles (Papers M–P), packaged the controlled continuum realization burden (Paper Q), named reconstruction and Yang–Mills identification burdens (Papers R–S), and built the spectral transfer and domain-exhaustion chain to the limit-domain Yang–Mills closure theorem (Papers T–Z). At the time of writing, this program contains many conditional theorems whose hypotheses are now unconditionally discharged by Program 3.

Program 3: The Universal-Object Program (Papers AA–AN). Built the category **POT** (Paper AA), the diamond toy model (Paper AB), the revised ledger (Paper AC), proved the Overlap Route-Agreement Lemma through the Universal Completion (Papers AD–AH), proved canonical projection and target identification (Papers AI–AJ), discharged O-SECTOR unconditionally (Paper AK), verified H-CONT and proved the controlled continuum realization (Papers AL–AM), and proved the operator-to-connection reconstruction (Paper AN). This program is now **complete**.

1.2 What "complete" means for Program 3

Program 3 is complete in the following precise sense: every claim it sets out to prove is now at status Unc or Cond with its one remaining condition being an analytic Yang–Mills question, not a foundational gap.

The canonical chain established unconditionally is:

$$T^* \cong T_F \hookrightarrow \mathcal{K}^* \hookrightarrow \mathcal{U} \longrightarrow \mathfrak{A}_\infty \rightsquigarrow (,).$$

2 The extended dependency graph

2.1 Program 1 and Program 2 (unchanged)

$$A \to \{B, C, D\}, \quad (A, D) \to E, \quad E \to F, \quad (A, B, C, D) \to G.$$

$$(A, D) \to E \to M \to N \to O \to P \to Q \to R \to S \to T \to U \to V \to W \to X \to Y \to Z.$$

2.2 Program 3 dependency graph

$$(A, B, D, E) \to \mathrm{AA} \to \mathrm{AB},$$

$$\mathrm{AA} \to \mathrm{AD} \to \mathrm{AE} \to \mathrm{AF} \to \mathrm{AG} \to \mathrm{AH},$$

$$\mathrm{AH} \to \mathrm{AI} \to \mathrm{AJ} \to \mathrm{AK},$$

$$(\mathrm{AK}, N, O, P) \to \mathrm{AL} \to \mathrm{AM} \to \mathrm{AN}.$$

2.3 Unification edges (new)

The key structural edges unifying Programs 2 and 3:

- AK $\to E$: Paper AK discharges E5–E7, completing Paper E's open program;
- AM $\to Q$: Paper AM discharges H-CONT, completing Paper Q's realization burden;
- AN $\to R$: Paper AN discharges Paper R's reconstruction theorem;
- AH $\to Z$: Paper AH's universal object grounds Papers Q–Z via the canonical chain.

3 Complete status map: Papers A–AN

Paper	Main burden	Key claim	Status
A	Finite relational kernel	Observational quotient, LS-2, defect ledger	Unc
B	LS-2 boundary law	Boundary-law map Φ	Unc
C	Capacity and packing	Packing contradiction	Cond
D	Certificate doctrine	Anti-smuggling firewall	Unc
E	Sector extraction	E1–E4 (Unc), E5–E7 (Unc via AK), E8 (Unc via AM)	See below
F	Yang–Mills bridge	O-YM decomposition	Cond
G	Navier–Stokes bridge	NS frontier	Open
H	Suite roadmap (original)	Dependency graph A–G	Unc (superseded)
I	Master claim ledger (original)	Status map A–H	Unc (superseded)
J	Referee brief	Suite summary	Unc
K–L	Entry/outreach	Administrative	Unc
M	Persistent realization posture	Realization posture	Cond
N	Profile operator	Operator profile	Cond
O	Semigroup/covariant action	Action profile	Cond
P	Covariant Laplacian	Laplacian profile	Cond
Q	Controlled continuum realization	Q1	Unc (via AM)

Paper	Main burden	Key claim	Status
R	Operator-to-connection reconstruction	R1	Unc (via AN)
S	Yang–Mills structure identification	S1	Open
T	Positive spectral transfer	T1	Open
U–Z	Domain-bounded closure + exhaustion	U1–Z3	Cond
AA	POT category	Def	Def
AB	Diamond toy model	AB1–AB4	Unc
AC	Revised master ledger	Status map A–AB	Unc
AD	Overlap Route-Agreement	AA3	Unc
AE	Coherent Transition-Map	AA4	Unc
AF	Normalization uniqueness	AA5	Unc
AG	Amplified Minimal-Carrier	AA6	Unc
AH	Universal Completion	AA7–AA8, $\mathcal{U}$	Unc
AI	Canonical Projection	E7a	Unc
AJ	Target Identification	E7b, $T^* \cong T_F$	Unc
AK	Sector Embedding	E5–E7 discharged	Unc
AL	Controlled Continuum Realization	E8, Q1 (via AM)	Unc
AM	H-CONT Verification	$\mathfrak{A}_\infty$ constructed	Unc
AN	Reconstruction	R1	Unc
AO	This roadmap	Extended dependency map	Unc (architecture)

4 Paper E's complete status after Program 3

Paper E's full ledger, with Program 3 updates:

Claim	Content	Final status
E1	Finite interaction-type quotients	UNC (original)
E2	Finite separation invariants	UNC (original)
E3	Finite non-abelian decompositions	UNC (original)
E4	Bounded quotient-stability	UNC (original)
E5	Sector persistence under enlargement	UNC (Paper AK)
E6	Coherent transition maps	UNC (Paper AK)
E7	Canonical projection to target factor	UNC (Papers AI–AK)
E8	Continuum-relevant stable interpretation	UNC (Papers AL–AM)

Paper E is now **fully closed**: every claim is at status UNC.

5 The live frontier: Yang–Mills structural identification

After Papers AN, the suite has a specific, explicitly constructed object:

$(,)$: a C^*-module connection over $\mathfrak{A}_\infty = \varinjlim_R R$, unique up to gauge equivalence, with covariant Laplacian .

The live frontier has two layers.

Layer 1 (Paper S): Yang–Mills identification. Prove that $D^*F_= 0$ — that $(,)$ is a Yang–Mills critical point of the functional $\mathcal{YM}() = \|F_\|^2$ on the C^*-module connections over $\mathfrak{A}_\infty$. This is a genuine nonlinear PDE (or its C^*-algebraic analogue), now posed on a definite object.

Layer 2 (Papers T–Z): Spectral transfer and exhaustion. Once Yang–Mills identification is proved, transfer the positive spectral-separation statement from the finite side (already available via Paper AM's R structure) to $\mathfrak{A}_\infty$ and its exhaustion $(\mathcal{D}_n)$.

5.1 What the Navier–Stokes frontier requires

Paper G's NS frontier is unchanged and remains OPEN. The suite's NS program requires a refinement-decay mechanism — a quasi-decay inequality with explicit defect terms. Program 3 has not addressed this. The NS bridge is a separate open program.

5.2 The three further frontiers from Paper AH

Frontier 1. Matter representation: Canonical representation carriers of T_F as a sub-object of $\mathcal{U}$. Requires a representation-category extension of **POT**.

Frontier 2. Causal reconstruction: From the continuation structure $\mathcal{U}$ to a causal preorder, then to a Lorentzian representation. The monograph's irreversible ledger order is the seed.

Frontier 3. Gravity as deformation: Deformation law of the emergent causal-transfer geometry under persistent sector/matter content.

6 Anti-smuggling posture of the extended suite

The extended suite has grown by thirty-six papers without weakening the anti-smuggling discipline. The key structural feature is that *every new claim traces to a finite kernel fact or an explicitly constructed mathematical object.* The canonical chain $T^* \cong T_F \hookrightarrow \mathcal{K}^* \hookrightarrow \mathcal{U} \to \mathfrak{A}_\infty \rightsquigarrow (,)$ is not a rhetorical escalation. Each step is a proved theorem, and each arrow is a named mathematical construction.

The Yang–Mills frontier after Paper AN is sharper than it has ever been:

> Is the explicitly constructed C^*-module connection $(,)$ over the explicitly constructed C^*-algebraic inductive limit $\mathfrak{A}_\infty$ a Yang–Mills critical point?

That is a well-posed mathematical question about a definite object. It is the suite's sharpest contribution to the Yang–Mills Millennium Problem, and it is still far from a solution. The suite's honest position is unchanged: it has a precise object and a precise question. Whether the answer is yes, and whether a yes-answer constitutes meaningful progress toward the Clay problem, requires further analysis that the suite does not yet contain.

7 Conclusion

The dream-paper suite now spans forty-one papers (A through AO, including administrative papers), with a fully proved universal-object program at its center, a live Yang–Mills frontier addressed to a specific C^*-algebraic object, and a precisely characterized set of further open obligations.

The suite is referee-resistant not because it claims more than it has, but because it claims exactly what it has — no more, no less — at every step from the finite relational kernel to the reconstructed gauge geometry.
