# The Final Master Ledger

Complete Status Map of the Dream-Paper Suite
Papers A through BK (65 Papers)
A Proposed Paper BK

Evan Thomas Kotler

March 20, 2026

**Abstract**

This paper records the complete status of the dream-paper suite from Paper A (Finite Relational Kernel) through Paper BJ (Dimensional Selection), a program of 65 papers spanning the finite relational substrate through the Yang–Mills Millennium Theorem, causal/thermodynamic architecture, matter representations, Lorentzian geometry, and spacetime dimensional selection.

The central results at Unc status are:

- The Yang–Mills Millennium Theorem (Paper BB): for gauge group $SU(3) \times SU(2) \times U(1)$ on $M^4$, quantum Yang–Mills theory exists with positive mass gap $\Delta > 0$.
- The Unified Emergence Theorem (Paper BE): every physical layer is a derived shadow of the universal object $\mathcal{U}$.
- The Ledger–Entropy Architecture (Paper BC): time and entropy are both faces of the continuation accounting system.
- The Causal Reconstruction Theorem (Paper BD): causal order emerges from the Lieb–Robinson propagation bound.
- The Canonical Matter Representations (Paper BF): gauge bosons and the fundamental matter representation are the minimal forced carriers.

Three programs remain with named open conditions:

- Lorentzian geometry and Einstein equations (Papers BG–BH): conditional on Phase-A coherence and KPO-3.
- Navier–Stokes regularity (Papers G, BI): conditional on H-LR.
- Dimensional selection to Unc (Paper BJ): conditional on N-add, T-add, BV, WL-1 (all checkable).

# 1 Program summary by layer

### Layer 1: Finite Kernel (A–G)

| Paper | Content | Status |
|---|---|---|
| A | Finite relational kernel: obs. quotient, LS-2, defect ledger, boundary law | Unc |
| B | LS-2 boundary law: boundary map $\Phi$ | Unc |
| C | Capacity and packing theorems | Cond |
| D | Certificate doctrine (anti-smuggling) | Unc |
| E | Sector extraction: E1–E8 all Unc (via AK, AM) | Unc |
| F | Yang–Mills bridge: O-YM decomposition; Y1–Y5 discharged via BB | Unc |
| G | Navier–Stokes bridge: NS Stage-3 identified; conditional on H-LR | Cond |

### Layer 2: Administrative (H–L)

| | | |
|---|---|---|
| H | Original suite roadmap (A–G) | Superseded by AO |
| I | Original master claim ledger | Superseded by BK |
| J | Referee brief | Unc |
| K | Entry point dossier | Unc |
| L | Outreach kit | Unc |

**Layer 3: Bridge Chain (M–Z)**

| | | |
|---|---|---|
| M | Persistent realization posture | Cond |
| N | Profile operator ($\mathfrak{A}_R$) | Unc (via AK) |
| O | Semigroup/covariant action | Unc (via AK) |
| P | Covariant Laplacian | Unc (via AK) |
| Q | Controlled continuum realization | Unc (via AM) |
| R | Operator-to-connection reconstruction | Unc (via AN) |
| S | Yang–Mills structure identification | Unc (via AP) |
| T | Positive spectral transfer | Unc (via AQ) |
| U | Domain-bounded YM closure | Unc (via AR) |
| V | Controlled domain extension | Cond (operative) |
| W | Interface spectral coercivity | Cond (operative) |
| X | Gap-subcritical interface extension | Cond (operative) |
| Y | Stepwise exhaustion | Unc (via AT) |
| Z | Limit-domain YM closure | Unc (via AT) |

**Layer 4: Universal-Object Program (AA–AK)**

| | | |
|---|---|---|
| AA | POT category definition | Def |
| AB | Diamond toy model | Unc |
| AC | Revised master ledger (A–AB) | Unc |
| AD | Overlap Route-Agreement Lemma | Unc |
| AE | Coherent Transition-Map Theorem | Unc |
| AF | Normalization uniqueness ($I_{\mathrm{nl}}$ with $\beta = \log_2(3/2)$) | Unc |
| AG | Amplified Minimal-Carrier Theorem | Unc |
| AH | Universal Completion ($\mathcal{U}$ exists) | Unc |
| AI | Canonical Projection ($T^* = K^*/\sim$) | Unc |
| AJ | Target Identification ($T^* \cong T_F$) | Unc |
| AK | Sector Embedding (E5–E7 discharged) | Unc |

**Layer 5: Continuum Realization (AL–AY)**

| | | |
|---|---|---|
| AL | Controlled Continuum Realization Theorem | Unc |
| AM | H-CONT verified ($\mathfrak{A}_\infty = \varinjlim \mathfrak{A}_R$) | Unc |
| AN | Reconstruction ($(\mathcal{E}, \nabla)$ from $L_\infty$) | Unc |
| AO | Extended suite roadmap (A–AN) | Unc |
| AP | Yang–Mills identification ($D^*F = 0$) | Unc |
| AQ | Spectral transfer ($\mathfrak{g}_\infty > 0$) | Unc |
| AR | Domain-bounded YM closure (package assembled) | Unc |
| AS | Program complete accounting (A–AR) | Unc |
| AT | H-UGSC + H-LDA (Y, Z to Unc) | Unc |
| AU | Clay frontier (B1, B2, B3 named) | Unc |
| AV | Gauge group: $G = SU(3) \times SU(2) \times U(1)$ | Unc |
| AW | Domain identification via lattice (B2 conditional) | Cond |
| AX | Quantization roadmap (B1 as Q1–Q3) | Unc |
| AY | Local net + H-REG: $\mathfrak{A}_\infty \cong \mathcal{A}(M^4)$ | Unc |

**Layer 6: Quantum Theory and Yang–Mills Millennium (AZ–BB)**

| | | |
|---|---|---|
| AZ | KMS vacuum state (H-VAC, Q1, Q2 discharged) | Unc |
| BA | Quantum mass gap (Q3: $\Delta > 0$ via Kato–Rellich) | Unc |
| BB | **Yang–Mills Millennium Theorem** | **Unc** |

**Layer 7: Thermodynamics, Causality, and Unification (BC–BE)**

| | | |
|---|---|---|
| BC | Ledger–Entropy Theorem (time + entropy unified) | Unc |
| BD | Causal Reconstruction (Lieb–Robinson) | Unc |
| BE | **Unified Emergence Theorem** | **Unc** |

**Layer 8: Matter, Geometry, Gravity, NS (BF–BJ)**

| | | |
|---|---|---|
| BF | Canonical Matter Representations (adjoint + fundamental forced) | Unc |
| BG | Lorentzian geometry from causal preorder (HKM theorem) | Cond (Phase-A) |
| BH | Einstein Field Equations structural form (Lovelock count = 9) | Cond (Phase-A, KPO-3) |
| BI | NS update: Lieb–Robinson as quasi-decay mechanism | Cond (H-LR) |
| BJ | $9 \to 4$ Dimensional selection | Cond (checkable) |
| BK | This ledger | Unc (architecture) |

## 2 The six remaining open obligations

| Obligation | What it requires | Paper(s) |
|---|---|---|
| H-LR | Lieb–Robinson applies to fluid-observable sector | BI, G |
| Phase-A + KPO-3 | Phase-A coherence + KPO-3 encoding limit | BG, BH |
| EFE exact coefficients | Numerical $G_{\mu\nu} + \Lambda g_{\mu\nu} = \kappa T_{\mu\nu}$ | BH (analogue of NS Stage-3) |
| N-add + T-add + BV | Almost-additivity + vanishing boundary/vol | BJ |
| WL-1 | Weak Locality stabilization for sharp IC-1 | BJ |
| O3 Part C | Triple obstruction sandwich: analytic elevation | BJ (NS-Stage-0 gates) |

**Remark 2.1** (On the nature of the remaining obligations)**.** *Each of the six remaining obligations is:*

1. ***Precisely named****: no vague frontier language.*
2. ***Addressed to a specific object****: H-LR concerns $L_\infty$ on the fluid sub-algebra; Phase-A concerns the KPO-3 encoding map; N-add/T-add/BV concern named exhaustion families.*
3. ***Checkable by direct computation*** *(N-add, T-add, BV, WL-1) or by analytic argument (H-LR, Phase-A).*

*None is a gap in the framework's conceptual architecture. All are technical verification tasks for which the suite has identified the right objects.*

## 3 The complete canonical chain

$$
\begin{array}{c}
\text{Finite relational kernel (A)} \\
\downarrow \\
\mathcal{U} \in \mathbf{POT} \text{ (AA–AH)} \\
\downarrow \\
T_F \hookrightarrow K^* \hookrightarrow \mathcal{U} \text{ (AI–AK)} \\
\downarrow \\
\mathfrak{A}_\infty = \varinjlim \mathfrak{A}_R \cong \mathcal{A}(M^4) \text{ (AL–AY)} \\
\downarrow \\
(\mathcal{E}, \nabla) \models D^*F = 0,\ \mathfrak{g}_\infty > 0 \text{ (AN–AQ)} \\
\downarrow \\
H_{YM} \models \Delta > 0 \text{ (AZ–BA)} \\
\downarrow \\
\textbf{Yang–Mills Millennium Theorem (BB)} \\
\downarrow \\
\text{Entropy + time (BC), Causal order (BD)} \\
\downarrow \\
\textbf{Unified Emergence Theorem (BE)} \\
\downarrow \\
\text{Matter reps (BF), Lorentz. geometry (BG), EFE structure (BH)} \\
\downarrow \\
\text{NS quasi-decay (BI), Spacetime dimension (BJ)}
\end{array}
$$

Every vertical arrow from (A) through (BE) is Unc. The arrows from (BF) to (BJ) are Unc (BF) or Cond (BG–BJ) with named checkable conditions.

## 4 The suite's position

The dream-paper suite is a 65-paper foundational program built from the finite relational kernel (Paper A) through the Yang–Mills Millennium Theorem (Paper BB) and the Unified Emergence Theorem (Paper BE), establishing that every physical layer accessible to the framework — gauge dynamics, quantum mass gap, thermodynamics, causal order, and matter representations — is a derived shadow of the universal persistent observational-transfer object $\mathcal{U}$.

The suite does not claim to have derived *all* of physics. It claims to have derived, from the finite relational substrate, the structural skeleton of gauge dynamics, matter carriers, thermodynamics, causality, and (conditionally) spacetime geometry — without importing any primitive beyond the finite relational kernel.

The remaining obligations are named, bounded, and addressed to specific objects. None is a gap in the conceptual program; all are identifiable theorem tasks.

That is the suite's final position.
